

How it works

Neostreamshop

♥ After adding the widget, your pet alternates between different looping animations

♥ You can interact with it using chat commands:

!angry

!drink

!pat

!cry

!fire

!pizza

!trick

!jail

!shower

!love

!extinguisher

!bestfriends

!ask

!say

The following events will trigger randomly:

🚿 Your pet can **get dirty**; if you see flies around it, use the **!shower** command to clean it

🍕 Your pet can **get hungry** and will let you know with a speech bubble; feed it using **!pizza**

🥤 Your pet can **get thirsty**; give it a drink with the **!drink** command

★ Your character also reacts to different stream alerts with unique animations.

⚠️ **The widget only reacts to real alerts.**
If you trigger a simulated alert from another software like Streamlabs, it won't respond.
(You can test alerts directly from the widget settings in StreamElements.)

💬 You can make your pet speak with the **!say** command followed by your message.

!say Hello Woldr

🗣️ Ask your pet a question using the **!ask** command followed by your question.

The character will respond with a random answer chosen from five predefined responses in the settings.

!ask Am I stupid?

Definitely!

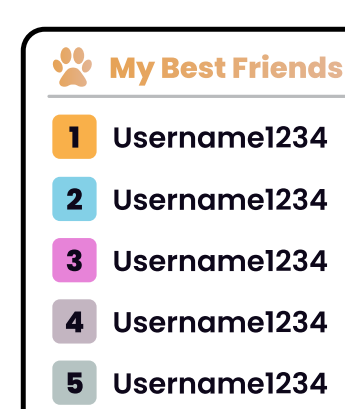

📖 Your character will also trigger random messages, which you can modify in the widget settings.

★ Your chat members can develop a stronger or weaker bond with your pet.

Every interaction they have will increase their relationship level. You can see your pet's best friends with the command:

!bestfriends

My Best Friends

1	Username1234
2	Username1234
3	Username1234
4	Username1234
5	Username1234

🔥 Your character will randomly catch fire; you will need to put it out using the **!shower** or **!extinguisher** command.

!extinguisher

!shower

⚙️ You can customize your widget and modify all the settings. If you don't know how to do it or need help understanding the settings, I recommend checking out the third guide: **"3 - Advanced Settings"**
